                                                                                                Antibodies which recognise specific subfragments of the beta-amyloid protein are claimed. Specifically, the antibodies (which are pref. monoclonal) recognise residues 1-16 and/or 1-28 from the N-terminal portion of beta-amyloid or they recognise residues 25-35 or 35-43 from the C-terminal portion. The antibodies are useful for assaying beta-amyloid and its derivatives for diagnosis of Alzheimer's
                                                                                                                                                                                            Antibodies recognising specific parts of beta-amyloid used for diagnosis of diseases implicating beta-amyloi Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                Amyloid precursor anti-beta-amyloid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The peptide is an internal fragment of the beta amyloid peptide precursor, which was produced synthetically. The peptide, when labelled, may be used in in vitro methods for the detection of Alpheimer's disease.
                                                                      Sequence

                                      CC A novel method has been developed of assaying for soluble amyloid CC precursor protein (sAPP). The method uses an antibody against amyloid CC beta-protein (A beta; produced from sAPP) or sAPP. The present sequence CC represents amino acids 1 to 40 of amyloid beta-protein. sAPP can be CC assayed accurately, and when including a monoclonal antibody recognising the N-terminus of A beta and a monoclonal antibody recognising sAPP, the CC assay can be used to diagnose Alzheimer's disease. Senior plaque CC observed in the brain of Alzheimer's patients is primarily composed of CC A beta, which is generated from sAPP, Simple and accurate assay of sAPP cis possible. The antibody (preferably monoclonal) preferably has an CC antigen recognition site which is an amino acid sequence common to CC A beta and sAPP, or specific to sAPP. The sAPP assayed for preferably CC solubilised through cleavage of the A beta between positions 16 (lysine) CC and 17 (leucine) from the amino acid terminus. The preferred method CC comprises immobilising one antibody (especially generated by (2)) on to CC antibody, reacting another, labelling, antibody with the assay substance cCC and detecting the activity of the labelling substance bound to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Amyloid

Peptides AAW23335-36 are portions of the the amyloid beta peptide, which CC is the principal component of extracellular deposits in Alzheimer's CC disease. It has been shown to promote nuerite outgrowth, generate CC reactive oxygen intermediates, induce cellular oxidant stress, lead to cellular oxidant stress, lead to competitive oxygen intermediates, induce cellular oxidant stress, lead to competitive oxygen intermediates, induce cellular oxidant stress, lead to cellular oxidate, which comprises annote is used in a pharmaceutical composition. The present cellular areceptor for advanced glycosylation of an amyloid beta peptide with a receptor for advanced glycosylation on the surface of a cell comprises contacting the cell with e.g. present peptide. Depending on the type of cell, inhibiting the interaction between the amyloid beta peptide and the cell withing the interaction between the amyloid beta peptide and the cepture for advanced glycosylation can be used for inhibiting cell beta peptide into a fibril, inhibiting extracellular assembly of amyloid beta peptide into a fibril, inhibiting aggregation of amyloid beta peptide into a fibril, inhibiting aggregation of amyloid beta peptide into a fibril, inhibiting aggregation of microglial cells by amyloid beta peptide. The methods can be used for treating e.g. cuberosis, neuronal cytotoxicity, Down's syndrome, dementia cassociated with head trauma, amyotrophic lateral sclerosis, multiple

                                                                                                                                                                            Query Match
                                                                                                                                                                                                                          The present sequence was used in the development of a novel in vitro screening assay for agents capable of affecting the deposition of beta-amyloid peptide (BAP) on tissue. The method comprises contacting a silk sample with labelled BAP, optionally in the presence of a test agent, detecting the amount of label bound to the silk and assessing the effect of the agent on the deposition of BAP. Agents that inhibit binding of BAP to silk are potentially useful for treating amyloidosis diseases, especially Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                               (HARD )

Alzheimer's disease is characterised by the accumulation of a 39-43 amino acid peptide termed the beta-amyloid peptide in the form of extracellular amyloid plaques and as amyloid in the walls of cerebral blood vessels. The invention relates to methods for the formation of congophilic maltese-cross spherical amyloid plaques, which are characteristic of Alzheimer's disease. The amyloid plaques are formed by co-incubation of this beta-amyloid protein with sulphated macromolecules. The methods can be jused to study the formation of amyloid plaques and to identify anti-plaque therapeutics. They can be used for diseases such as Alzheimer's disease, Cretzfeidt-Jakob disease, Gerstmann-Straussler and the state of the sease of the sease

Determination comprises: (a) incubating a sample of unaggregated (I) with Coomassie Brilliant Blue G 250 dye (II) which only binds to unaggregated (I); (b) measuring the amount of (II) bound to (I) to obtain a value (i); (c) repeating steps (a) and (b) with a second sample at a different time to obtain a second value (ii); and (d) determining the difference between (i) and (ii) which is inversely related to the degree of aggregation of (I). This method may be applied to a screen for compounds that inhibit aggregation of (I). These inhibitors may be used as therapeutic drugs to inhibit the formation of these aggregates in the brains of patients suffering from Alphaimer's disease.
and can be used in the method of the invention. The method is for inducing amyloid plaque deposition in a mammal by infusing into the brain an amyloid peptide (I) at a basic pH. Animals in which amyloid plaque deposition has been induced are models of human Alzheimer's disease (AD) and are used to screen for agents (A) that inhibit: (a) deposition of amyloid plaque; and (b) An-associated disruptions to sleep and circadian activity. They may also be used to study the ethology of AD. Compared

                                                                                                                                                                                                   This sequence corresponds to an aggregating amyloid-beta peptide which can be covalently labelled with a fluorescent group. The detection or monitoring of an amyloid aggregate in a sample can be used to diagnose or detect a predisposition to Alzheimer's disease. The screening assay can be used to identify compounds for the treatment or amelioration of Alzheimer's disease or its symptoms. The fluorescent derivatives of the stream of the screening assay can be used to identify compounds for the treatment or amelioration of Alzheimer's disease or its symptoms. The fluorescent derivatives of the screening assay to the stream of the screening assay to the stream of the screening assay to the screening assay 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             pH (I) is soluble enough for delivery by continuous infusion with fective delivery to brain tissue. The control peptide causes few, if any, plaques and does not stimulate an immune response. Most (I)-treated animals develop AD-type pathology (contrast transgenic models of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        disease),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     with known methods for inducing plaque deposition, this process causes less mechanical damage; the vehicle used is less neurotoxic and at basic
                                                                                                               Sequence
                                                                                                                                                                              Alzheimer's disease or its symptoms. amyloid-beta peptide are also useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                       WPI; 1999-190112/16

                                                                                                                                                                                                   밁
                                                                                                                                                                                                                          Š
                                                                                                                                                             RESULT 12
                                                                                                                                                                                                                                                       Matches
                                                                                                                                                                                                                                                                                                                                                      This invention describes a method for screening compounds for inhibiting a neurotoxin. The method involves incubating tachykinin agonists with neuronal cells and a beta-amyloid peptide neurotoxin. The methods can be used for identifying compounds for treating diseases characterised by an undesirable build up of beta-amyloid protein, e.g. Alzhaimer's disease, Down's syndrome, and the syndromes of hereditary cerebral haemorrhage with amyloidosis and non-inharited congophilic angiopathy with cerebral haemorrhage. ANW2655-W92731 are tachykinin agonists derived from human had a control of the syndromes of hereditary cerebral haemorrhage.

peptides. The invention provides a process for treating a synthetic Abbta peptide that comprises dissolving the peptide in a deoxygenated solvent selected from trifluoroethanol, hexafluorocyclohexane, dimethy sulphoxide, morpholinopropanesulphonic acid, dimethylfornamide and acetonitrile to a concentration of 0.01-10 mg/ml, incubating the solution at 20-65 deg. C for 0.5-4 hour, and removing the solvent by 'evaporative deposition', in 5-10 minutes. Synthetic amyloid beta peptides are useful as research tools for studying neurotoxicity resulting from Abeta peptide -enhanced free-radical production. The treatment increases the activity of the synthetic Abeta peptides in te to determine free-radical generating capacity and glutamine synthetase

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         that contribute the neurotoxicity of amyloid beta. The chimeric peptides are useful for immunizing humans against the free N- or C-terminus of an internal self peptide cleavage product (e.g. APP peptide) derived from a precursor protein or a mature protein. The internal peptide cleavage product is the self molecule of the mammal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      beta-amyloid precursor protein (APP). The peptide is used to create chimeric peptides of the invention. The chimeric peptides contain a Northernic peptides contain a Northernic peptides contain a Northernic peptide cleavage product of a precursor or maturally occurring internal peptide cleavage product of a precursor or mature protein, as a free Northernic peptide to a Toell epitope, with or without a spacer amino acid residue. Chimeric peptides comprising betaAPP peptide in the extracellular space, interstitial fluid and cerebrospinal fluid of the brain, and aggregation into senile amyloid deposits or plaques. They also block the interaction of amyloid beta peptides with other molecules
                                                                                                                                                                                                           Homo sapiens.

(I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases intracellular uptake and interference with physiological processes. AAB90829 to AAB92441 represent peptides which can be used in the cxx
                                                                                                                                                                                                                                                                                                           Query Match 100.0%; Score 40; DB 22; Best Local Similarity 100.0%; Pred. 219241 seqs,

Searched: 76174552 residues

Word size :

Total number of hits satisfying chosen parameters: 219241

Minimum pB seq length: 0
Maximum pB seq length: 2000000000

Post-processing: Listing first 45 summaries PIR\_68:\* pir1:\*

pir2:\*

and is score No. is the number of results predicted by chance to have a greater than or equal to the score of the result being printed, s derived by analysis of the total score distribution.
